Quote:

For reasons unknown to me the A1 boards eat batteries like we eat popcorn while watching the Amiga Inc. saga.

Two different things.

The XE battery eating begins with a perfectly fresh battery, if Kurt Grach's theory on PCI leak holds water.

The Micro battery drain is nothing more than what sundown said. Once the CR2032 cross the threshold of 3 it drains more quickly (end of life). Think of it as a bezier curve or exponential loss if you will.
