@ssolie

If it happened once, I could believe a coincidence.

But after about an hour, I replaced the old pre-july software and the problem disappeared. Completely, and remained gone for many hours of heavy use.

So the problem "appeared" during the very first boot after installing the upgrade, continued to cause a lockup within three minutes every time, then disappeared completely when the old software was reinstalled.

Now THAT would be quite a coincidence.

So I repeated the entire test, this time with a fresh download to make sure I didn't have a bad copy.

Within two minutes of the second installation of the update, the problem appeared again, right on cue! I tested it about a dozen more times, with a lockup every time.

Then I restored the previous software, for the second time, and as soon as I rebooted with the original kickstart modules, the lockup problem disappeared again.

So, if you want to call that coincidence, there is nothing more I can do to convince you.

Speaking for myself, I'm sure it's not.

As a troubleshooter, I would find information like this to be VERY valuable, if I was interested in learning more about the problem.

Of course, if I wasn't interested in fixing the problem, then it would definitely be easier to blame it on coincidence.

Since I don't have access to the code, I'm done now.

It's your call.
