>150 dosbuffers on a ~30 GB partition? no way!

Do you mean that the amount of 150 dosbuffers are responsible for the problem?

It shouldn't, it's only much slower than it could be with that few buffers."

nope, not necessarily. I was pointing out that being the user using a misconfigured SFS for HD recording (with recycled) the dosbuffers could be part of the problem.

Or more simply he have an HD full of bad blocks.

btw ... do you think is a good idea using SFS with a slightly larger blocksize (1024-2048) for HD recording? (still without .recycled)

About Raziel i still don't understand if he is speaking about AOS4 on AOne or Classic! 😊
