Understood, though you don't say what would be a good buffers setting for, lets say

**256 MB**

**500 MB**

**1 GB**

**5 GB**

**10 GB**

**25 GB**

**70 GB**

partitions...(that being my partition sizes)

It doesn't depend on the partition size but on the number and sizes of the files and directories, how they are used, etc.

The only way is to check the cache misses with SFSQuery after using the partitions as usual for some time, if you get more than 1% cache misses you should use more buffers.
