I have a question on this issue. What is the file-size limit for SFS\2.

Theoretically 256 TB, but the max. partition size is smaller, 2 TB for partitions with 512 bytes/block.

Is it possible to be used succesfully with AmigaOS 3 and the scsi.device of IDEFix installed?

I don't know if the IDEFix scsi.device has working CMD_UPDATE support. The AmigaOS IDE scsi.device did **not** until AmigaOS4.

Additionally nearly all software has to be changed to work with files > 4 GB, for AmigaOS 3.x there is probably next to none.
