As suggested by tonyw in another thread I'm starting this new thread to talk about IDE Zip drives.

I recently (after installing OS 4.1) get out of my desktop's drawer my old ZIP disks and I have experienced some strange things : sometimes the system refuses to go down a drawer (both from WB and from DOpus4) giving me a lock error IIRC. If you wish I can try to reproduce it and give you more details in order to fill a bug report, just let me know.

Also I have experienced problem (only after the above error IIRC) when ejecting the ZIP disk and reinstering a new one with same name : the icon of the first disk still remains on the WB and no new icon pop up for the new disk...

Oh and I almost forgot to say that disks are MSDOS formatted (I used them to transfer Aminet programs from work to home when I only had a slow time limited dialup connection).
