sfssalv fails to recover directories from a damaged partition

URL:

i just discovered today that one of my partitions disappeared from the desktop. it is seen as unformatted maybe due to rdb failure. the data system can be completely detected by sfssalv as far as i was able to judge it. but after running recovery onto another clean partition the directories cannot be opened anymore. in oposit to data in root that are accessible without problem. the space used by the data on this new partition seems to indicate that in fact everything has been recovered. it is alltogether about 1.3gb. i wonder if there is some bug in the program really, it seems it is put together a little carelessly at least what concerns gui.
