@joerg

sorry to say, even partition magic under os4 with sfs partition as a target had the same effect. some 1.3 gig data are being recovered, of which only that in the root directory are accessible. various attempts of using protect command to unlock the directories didnt succeed. may it be the directory tree is damaged beyond repair but 1.3gb of what data are sfssalv and partition magic recovering then, since they spit only a few warnings underway and continue to what seems to be some succesful end?
