except for 2 also incomplete directories the dir command from shell doesnt show any other, only the icon files for the missing ones. i can also enter these present dirs via workbench. i had not realised it before.

You wrote "the space used by the data on this new partition seems to indicate that in fact everything has been recovered. it is alltogether about 1.3gb.". Does that mean there are about 1.3 GB data in the root dir, and there wasn't much in sub directories?

You can try again with the mode set to "All/Deep" in the 3rd tab, usually that way you get much worse results but in a few cases, especially very destroyed partitions, it works better, and in your case it can't get much worse. If that doesn't help either too much data on the partition is destroyed and recovering more from it isn't possible.
