URL:

hello,

I have a new OCZ 16go rally usb key, since one week. Copy for the third time with. first copy was some ko, second copy was some mo, last copy was the entire AOS4 software (for save) around 1GO. SAM+aos4.1 system used.

the copy has been made with dopus4 PPC (last version translated in french).The copy was practically finished (around the GO copied) but suddenly, on the amicygnix part, impossible to create lots of drawer located on amicygnix.

NOTE:I remember the place of the drawers on amicygnix.

I stop the copy with dopus4 and impossible to make another copy.

the key show his name with poseidon/classic but impossible to create a copy on. linux debian unable to recognize/mount the key. Same with vista.

this morning, at job, the key has been recognized by XP and possible to format (normal and quick) the key with XP, and actually trying to full the key with datas. NOTE: 4go copied without problems.

content of the corrupted key (from a grab before formatting the key with XP):

```
t-firm ..if      1673886 ko
p $&.\".cov    1661659 ko
p&.bp1&..pg    1824969 ko
nt-abstr.act    1624963 ko
ov@print.-da   file folder
ov@print.-ti   file folder
```

impossible to copy or delete. fortunately, format fat32 work with XP. (Of course, the original files are AOS4 OS and AOS4 programs, no files with around 1.6 go each).

the fault: AOS4.1 - dopus4 PPC - this new key (actually filled with XP) ?????? don't know really....

If you have advices...

1. all files look like are 8+3 files.
2. key was FAT32 formatted on factory.
