@broadblues

yes, the 20 ko crashlog file (.txt) content recover all the name of the files previously on the fat32 USB key.

of course the size of the file are wrong also on the key.

- I really would like to contact an experienced person on the AOS4 team for having technical explanation or try to resolve this problem ????

NOTE: BTW, strange thing because dopus4PPC show on the left or right list, the icons with rw_d and if I click on the icons, rawbinf show me as rwEd. Maybe the problem is on dopus4 PPC ????

Broadblues, I'm verry interested to know how format the key on linux as FAT32 as I have also linux on the SAM !!!

Could you explain that to me ???
