OS4 enforces the rule which should have been enforced all along: A removable volume does not have an RGB (the acronym does stand for **Rigid** Disk Block). And vice versa, a volume with an RGB is not a removable volume.

At least this is how I understood the word of the elders back when it was last discussed.

Also remember that the RDB among other things is expected to carry information such as Last Disk and Last Unit. That also goes against the idea of it being there one moment and gone the next.

Best regards,

Niels
