I think that i dont know more than you.

I know two things.

1. OS4 Dopus4 link handling is broken. Use Drag'n'Drop on WorkBench to make large copies that may have links. AsynWB seems to handle links and large copies with nested directories much better than Dopus4.
2. Copying Amiga files to a Fat32 formatted device of any kind is problematic. Amiga file names can contain characters that are illegal in Fat32. I only copy individual files (one at a time) for a Fat32 formatted USB stick, which works. I have formatted my 16GB USB memory sticks with SFS filesystem and can Drag'n'Drop entire partitions to the USB stick with no problems. Such copies seem to take forever because of USB1 speeds but nevertheless it works.
