The public one, from latest SDK. Or you ask what is GDB itself ? (debugger+tracer, etc. Very common in unix world for debugging, finding the bugs, disassembling (making assembler outputs) and jump deep into details). That is one of important programmes which we "Almost have" on os4, and which will help a lot many programmers to develop their apps (can't say for everyone, but i am personally will be in interest to have normal version of it on os4).
