I've downloaded both the files! Yay!

Both unarchive and burn to the CD! Yay!

Neither of them work!

GARGH.

AmigaOne build (burned with MakeCD, verified with AmiDVD) starts to boot, then black screen after a ten seconds or so. Booting with no startup-sequence shows that it's IPrefs that's crashing, Guru'ing (80000003) in window.class. Nothing I've been able to do so far has made it do anything else.

Sam440ep build (burned with MakeCD, but not verified) starts to boot, then black screen after ten seconds or so. I've not been able to boot with no Startup-sequence for some reason (can't get into the boot menu) but I can guess what's going wrong.

Anyone got any suggestions? 'cause at the moment it just looks like someone stuffed up the build.

My A1 has:

Radeon 9250

1GB RAM (2x512MB)

Sii0680

Sii3512

SB Live!

Catweasel Mk IV

Onboard IDE:

60GB PATA HDD

MSI CD-RW (seems to be working iffily at the moment so booting off the other drive)

Sii SATA:

80GB SATA HDD

Lite-On DVD+-RW (CD1:, booting with this drive).

My Sam is vanilla except for a TV card.

No-one else had this problem? Can't believe it's happening on both systems. In the UK, by the way.
