Hi,

I just thought I'd give you guys the heads up that after a little research (and a lot of hacking (with my own code and MP3 files that is - not other peoples!)) I've managed to get the MP3Cast plugin working in **true** gapless mode for the majority of MP3's. This includes Amazon and iTunes MP3's.

This means you can finally play albums where a track continues from one to another properly without a gap (needs TuneNet to be in Gapless mode). I'm particularly pleased as it doesn't involve any DSP routines and will work with the current mpeg4 library.

Thought I'd share that with you all :) I'll release the updated plugin soon.

Cheers,

Bean.
