I owned and updated the commercial CrossDOS for OS3 for years and the manual always suggested or warned that disks should be formatted with a real MS PC. With OS4.x I stick to single file copies to a single directory on USB memory sticks. Large copies (dragging a partition to the USB stick) seldom work properly for me with FAT formatted sticks. I formatted my 16GB USB memory sticks with SFS and use them for backup. There seems to be a speed difference depending on the stick size. My first 1GB stick was really fast. They seem to have gotten progressively slower as I bought bigger sizes (2GB, 4GB, 8GB etc.) It seems especially noticeable on the 16GB stick I've got. It seems really slow.

All my USB hardware are really factory formatted with a PC (untill now).

What does that mean ?? you make a drawer on the USB key and copy all inside surely....

About the speed to copy to the 16gb USB key I have is when copy the 3500 small files inside AISS, the last one has been copied with verry verry slow speed (first one with correct speed).
