n a first thought I suspected a too small TuneNet internal buffer to be the problem or some change in the disk access code - but I assume that you haven't changed much there from 1.14 to 1.19...

The way the sound is read and buffered changed drastically with the first release of the Gapless plugin.

The good news is I can (sort of) recreate the problem by using a pen stick (I don't get any crashes though, just the odd sound break). I'm going to do some more tests. Can you tell me what your player priority setting is set to?

Thanks,
Bean.

Edit -> Also I don't get the high CPU usage that you seem to get.
