@desler

I've downloaded it and install it :

2 things (after some minutes of use):

1st: always same problem with printing : I can't ! The problem comes from ghostscript. Could you make a printing option without having to use GS ?

2nd: why a temporary file with the name of the font is saved in RAM ? What it's used for ?

Otherwise, thanks for this new version. It is faster and also the pull-down menu of the fonts choice and size.

Nic
