WB moves my icons alone...

On what criteria WB automatically moves icons on the WB after its opening ?

I have my drive icons on the left border from top to bottom of my WB and I want my RAM disk to be the first one, other eventually don't matter, so I snapshotted the icon at the right position, then copied back the RAM:disk.info to ENVARC:Sys/def_ram.info then I reboot. For a short period, I can see that my ram disk is effectively the first icon, then for an unknown reason icons are rearranged and ram becomes the last.

What happened ? Why ? How can I prevent this ?
