Hm. Not many possibilities left...

- Changing SATA port.
- Changing to a new, shiny SATA Cable.
- Complete re-partitioning/permutation of file systems.
- successive down grading UDMA, testing with PIO access.

...nothing helped, still sporadical sys freezes with the mentioned error in the debug buffer. So'll put in a new hard disk permanently. Hopefully this will \*not\* show the same behaviour, 'cos then it might be the SATA controller, bad RAM, funny PCI whatsoever... 😞
