URL:

I've uploaded a test build of the latest development version of NetSurf. You can get it from the "test build" link on the AmigaOS download page at <http://www.netsurf-browser.org>

This fixes a couple of problems being experienced with 2.6, with frames and SSL. It also adds WebP image support and contains the new treeviews for history, hotlist and cookies.

The treeviews in particular are not well tested, I'm aware of some redraw issues. Please report any problems here.
