Unpacking, and run without installation

Please, please, please use the install script. It exists for a reason.

Quote:

IT ask me for screenmode. But imho will be cool, if by default it will be opens on the current WB screen,

USE THE INSTALL SCRIPT.

Nextly, after it runs, i trying to go to prefs and change on public screen, and press USE - nothing works. I choice public screen and press USE - nothing works. So, then i press SAVE, exit, and it crashes on exit with MemGuard output (no GR), with pointing to rgt and graphics library. But machine are not lockups, so i can run the same binary again, and it runs on public screen (so, SAVE works for prefs).

Yes, you must SAVE and EXIT for these changes to take effect. This is mentioned underneath all the options on that tab (maybe it isn't obvious enough, but that "you must save and exit" applies to EVERYTHING on that tab.

The memguard hit is something to do with gif_finalise or bmp_finalise, I'm aware of this already.

Also trying go to Youtube, and none images are loaded, and i cant press button with my account (netsurfs say : Warning, button can not be activated!).

It's probably a Javascript button.

Chris
