ASL req: bug or feature ?

Have notice interesting bug/feature in asl req:

For example you choice to save some file to some place, in which, you already have old version of that file (with the same name of course). So, when you are in asl req, you by RMB choice "rename" (to rename old file to something like old_file.c_save) , and press enter to make changes and , at this point in the File field (where you choice name for file to save), you have also name of renamed file. But imho, rename should be just rename, and save file should be no changed ?

Because of it, when i rename old file, i need to swith to File area again, and delete new letter which come from rename, to make default name of file. It is bug or just supposed to be like this in asl ?
