My gripe about the ASL filerequester is the GUI layout rather than the look.

* The OK, Volumes, Parent and Cancel buttons are in one group yet they have different functions and scope of operation (OK and Cancel control the entire requester, while Volumes and Parent only control the file list).

This is true but on the otherhand it makes efficient usage of screen space.

Quote:

* OK and Cancel are related mutually exclusive choices yet they are separated from each other in the layout.

This is the correct thing to do, it makes it much less easy to click the wrong option by accident.

Quote:

* Create New Drawer, a rather common function, is buried in the menu.

But the save requester will create drawers for you if you specify a non existant drawer in the path gadget. So no button necessary.
