With regards to your MUI variant, I'm not sure if I'm seeing the same as you here.

I run YAM on it's own screen, and that screen is defined via MUI settings and named YAM

If I cause AWeb to open on YAM's screen then iconify YAM the screen ofcourse remains open. If I then close AWeb the YAM screen does remain open. If I then uniconify YAM it happily reoccupies it's named screen.

Like wise if I quite YAM with AWeb on the screen AWeb prevents screen closure, and the screen remain open once I quit AWeb. Restarting YAM, and YAM happily occupies the named screen.

This seems to slightly conflict with your example where SimpleMail can't open it own screen (because it's open) and defaults to the workbench.
