ReAction window not remembering its position.

I think I just found a bug in ReAction. OS4.1.2

It seems that if I open a RA window with WA_Left, WA_Top, WA_Width, WA_Height flags (which I have saved in prefs) it's all fine. But if I move the window, then close it using RA_CloseWindow() (not destroying the object!) and then open it again with RA_OpenWindow it will have forgotten the new window position it was closed at, and again open at the original position first given when it was created.

Now, however, if I not only move the window but I also resize it, THEN it remembers both the new size and position if I close and open it. I'd say that's a bug. It should always remember as long as I don't destroy the object of course.
