Really nice idea!

But I will donate only if the program have visual editing GUI with video thumbs timeline(so a reather modern GUI).

I think that with avcodec.library that wasnt so hard to do...

The avcodec.library doesn't include the encoders, which a video editor would need. The author was going to put those into a separate library. Perhaps it would be an idea to have a bounty for updating the avcodec.library and adding the avencoder.library first, and a video editor bounty later.

Before I got sidetracked into updating MiniGL and working on graphics drivers, I was working on creating a new video base datatype with modern features (multiple codec support, hifi multi-track audio, multiple video tracks, etc.). My ultimate goal was to write an AmigaOS video editor that used the datatypes for decoding and encoding. I still have the code, but no time to work on it. If someone with suitable expertise wants to take over, I would consider opening up the code.
