For the encode why dont simply mafe a raw(or something strandard) and than use ffmpeg to encode it?

Outputting raw files and then using ffmpeg to encode it is rather ugly. It would be a hack done in order to avoid doing things properly.

BTW, libavcodec is part of the ffmpeg project, except its statically compiled into the binary. I really think that this should be done right. By using the avcodec.library and having an avencoder.library, the code will be usable by all applications that need it. Otherwise, every application that needs video encoding/decoding will end up having the entire libavcodec statically linked in (or using the ffmpeg binary externally which would be ugly). That is NOT the way that things are done on the Amiga.
