Those are two good observations, a simpler video editor for slower systems or with beta video drivers would be a good idea. I had some time ago the idea to update the FLTK port and after that try to port Open Movie Editor, but after Blender has been released I started using it instead. BTW Hans' idea to have the codecs inside a library, then to have an editor using it is even better, while I don't think the idea of using 2 MPlayer instances at the same time and to hack them would be a good idea, it's much better to start from scratch and code a small native application, or port an existing software instead.
