Qt browser (has anyone tried it? It is located in "qt:demos/browser").

I've just managed to get this downloaded, extracted and installed (installing took a few attempts - I think ASR didn't like the huge install, plus I was trying to update it on SYS: which didn't have enough space, so I've done a new install).

Just tried launching the Demo Browser and I get error "Failed to load shared object libQtUiTools.so". I only have libQtUiTools.so.4.7.0. Maybe some symlinking required here. There are a couple of other libraries that might have the same problem too.
