Hmm, it's actually really useable, after I re-enabled the native painting etc options. With native menus switched off the non-native menu bar gets printed over the top of the top window drag bar and the whole window contents are offset in a way they shouldn't be!

Also pressing ctrl-right in a text area (like the one I'm typing in now) makes it crash, although I didn't save the crashlog. Should be easy to reproduce though.

I note that it has the 72dpi tiny text on amigans.net problem, you might want to make the dpi customisable to fix that (not sure if it is only the native font engine having that problem as I'd need to quit and relaunch to find out, and I'm busy typing a forum post...!)
