fair enough...

Quote:

I only checked "file / save" "file / save as" option. There is another way in this program to save playlist ?
(not in front of my Amiga)

Yes, the export way... see my edited stuff above

Quote:

-I remembered that I tested to remove tracks from the list and that it worked.

How did you do that? Maybe it is my "native" paint engine I have to use on X1000?

Quote:

-yes, explorer don't worked for me, I showed file but was not able to navigate backward.
-drag'n drop don't work on Qt (never worked on all Qt programs that I tested)

What for did the author then implement the fileexplorer?

Quote:

-tree view worked (tested with a list of 2 artists)

try to create a "new" playlist, does it still work? Can you delete titles from there?

Quote:

-columns resizing worked

strange, not for me?

Quote:

-recent files worked

yes, you are right. My fault, they do work...

Quote:

-buttons worked

Toolbarbuttons don't work here. Try to start program, click on "New" toolbarbutton -> works, no problem... -> examine a directory/add files to playlist -> buttons don't work anymore...

EDIT:

Ah... got the reason why buttons don't work:

When using native AOS requesters, they don't work? When using inbuilt qt requesters, everything works, strange, isn't it. BTW this doesn't happen in Qt Textedit example...

However, thank you for your effort.
