Well it is not just displaying of Umlauts... it is the problem, that files/pathes containing "Umlauts" are not read at all -> Getting rid of all "Umlauts" in my filesystem is a bit to much...

But indeed, I just tested other software as well (EasyImage Sizer), none of them can handle "Umlauts" inside Filenames, trying to read images inside a directory which contains "Umlauts" somewhere inside the path, it will completely be ignored, guess this is a Qt problem.

Problem 8) is about resizing colums with my mouse inside the table:

Resizing Cellhight works, cellwidth/columnwidth doesn't. I donnot even get a mouspointer which looks different. However inside qOrganizer and qt based spreadsheet software column resizing works very well?
