I was wondering why this news, then I realised it was Qt\*5\* (doh).

Now the stupid question: What can we do with Qt5, that we couldn't be Qt4.7 ? (I know it's more modern, but what needs it?)

The biggest difference as a developer is the way of connecting signals and slots has changed whereas before it was

```
connect (signal_object, SIGNAL (...), slot_object, SLOT (....))
```

in Qt5 it's

```
connect (signal_object, SignalClass :: SignalFunction, slot_object, SlotClass :: SlotFunction);
```

It feels quicker than Qt4 (on Windows at least). This will definitely make the app I'm developing way easier to release on the Amiga as I'd already converted all of the signal/slot to the new style
