Of course I will continue to produce quickfixes for Qt4.7 as issues come in and as time allows. If there is some pressing issue, please be a little persistent about it, since I tend to forget what has been written at what time etc. I still have a list that samo79 has written, but there might of course be other things in orbit.

@Chris

I could simply make Qt5 reference a qt5: assign instead of qt:. That should be easy to do.
