yes I have a 9250.

Fixed it.

I simply changed the aos4 exe to launch from workbench instead of shell and increased the stack to 500000.  
There is no icon included in the os4depot archive.

Also I changed the config to highspec amiga 1 this resulted in corrupted graphics - all blocky and text unreadable. Leaving it at medium spec works very well. Anyone else get this glitch?  
Performance is just ok on the 9250. Can we expect great improvements on RadeonHD hardware or is the performance bottleneck CPU rather than GPU?

Awesome game and port! Still cant wait for RadeonHD drivers....
