Hello all

You can also test your 3D card with Aminet/Cow3D

As it dont use SDL nor MiniGL but only basic Warp3D so it give the maximum speed you can expect with your card (with a Warp3D driver. I hope a Gallium3D driver will be faster...)

Running simply cow3D give an fps value : it is a transform+draw speed (cpu speed + bus speed + gpu speed)
Then type 'b' it will bufferize the animation (ie no more calculate the cow rotation) and give an other fps value =
this one is the "draw" speed only (bus speed + gpu speed)
