Sorry, I have no link as it's on my local network.

I have taken the <http://curl.haxx.se/ca/cacert.pem> and renamed it in curl-ca-bundle.crt but no difference. Even with the 1.16 curl-ca-bundle.crt it doesn't work.

For my REXX stuffs (WebReplay), no problem, they don't use Odyssey ARexx port, they are simply written with Arexx.

In your FastFix1, when Javascript webpage is loaded (<http://www.google.fr/webhp?nord=1> or <http://fr.yahoo.com>) I have a requester "Hello Google" or "Hello Yahoo France". Maybe a debug somewhere ?

By curiosity, for you, when you watch YouTube video (for example, your Dead Kennedy sample), is your CPU always at 100% ?

On my X1000, spoofing as iPad with latest Fab script, YouTube videos are not really smooth, input is very slow because my CPU is constantly 100% busy.

Edit : I just see that you speak about that on the other 1.23 thread...

Thank you

edit : maybe a Curl problem.

In CLI, with current OS4Depot Curl version,

curl <https://192.168.1.34:5001/webman/index.cgi> --insecure

works only with --insecure option.

Do you have a curl binary from the Curl library used in Odyssey 1.23 that I can test ?
