Is the new libcurl of the AOS4 1.23 who could be the culprit ?

Dunno. At least as far as i hope i build it correctly (curl i mean, you can check progress-thread somewhere in the middle) with all tasty things need it. If you in interest, i can compile test build with version of curl used in mos 1.23 build, as well as with latest curl svn, so we can see if it happens because of curl, of because of something else.

Sadly i haven't any links to test with, that can be pretty much faster.

Unfortunately the scripts don't work. I have copied the scripts from the 1.23 archive and these scripts work with YouTube.

Because someone didn't read readme :) I.e. if scripts didn't works always go on Fab's page for latest ones. Last youtube.js currently are 0.95 , while in my archive was 0.94.

But to avoid hassle you can just use youtube-center script (check youtube speed thread for details)
