AmiKit USB Flash Disk boots into special Linux environment, called AmiPUP, where AmiKit 7 is pre-installed. AmiKit runs under E-UAE emulation there.

AmiPUP is a very small lightweight “live boot” Linux system built on the Slacko Puppy Linux distro and is customized to look like an Amiga.

AmiPUP works with almost any x86 computer (not including Macs) that can boot from CD or USB.

At boot, AmiPUP loads EVERYTHING into RAM, so all applications load blazing fast! Changes can be saved to the USB or multi-session CD boot device (or not at all). The host system is never touched.
