- 1) Most of the time, the sound card is found automatically. However, since that doesn't seem to be the case for you, try running "Prefs/Setup/ALSA Sound Wizard" and see if that helps. Sometimes, it's just a matter of un-ticking the "mute" checkbox or raising the volume sliders. Some settings can also be accessed by right-clicking on the speaker icon in the system tray.
- 2) Not sure where you would download additional language packs for AmiKit. I looked at the AmiKit site myself and couldn't find them. Jan?
- 3) From the "File" menu at the top when you run E-UAE, select "save config". There is a known issue with E-UAE on Linux that causes slow downs in some situations if more than 32 megs is selected. I never saw it, but during testing, someone else did, so the memory was left at 32 megs. Netsurf wants LOTS of memory!
- 4) I'm not sitting in front of AmiKit at the moment, so I can't say exactly how -- but the backdrop is changed via the DOpus environment controls, NOT the normal Amiga backdrop pref.
- 5) Some of the options for E-UAE can't be set from the GUI. Additional settings are controlled by a file called .uaerc that is located in the root folder (the folder that opens when you double-click the "Home" icon on the desktop). Click the "eye" in the window toolbar to show all icons. Changing the setting called "use_gui" to "no" will make AmiKit start without displaying the gui first -- most of the other settings are self-explanatory. I have never had much luck with full screen, but I am not an expert in E-UAE. Perhaps someone else can help with that.

Thanks for trying AmiPUP!
