Hi all.

I've just uploaded this game to OS4Depot. It's a platform jump 'n' run game. The few first levels look overly simplistic, but as you go on further, it's actually a pretty good game. It's version 0.5.4 from the SVN repo.

I'll upload some screenshots tomorrow. I made an addons pack that includes all the extra contributed levels that were in the SVN repo. Some of them can be downloaded from the within the game itself.

Let me know what you think. If you have red/cyan 3D glasses, you can run it with -c to get a 3D effect, but it slows the framerate right down on my system.

Press F to switch between fullscreen/window while playing. And please resist the urge to press the escape key! That quits the game immediately. Use "Q" instead if you just want to exit to the main menu.

If you wait and wait at the main menu, it'll go into a demo mode and you can see a bunch of different levels being played.

Thanks to Raziell^ for telling me about this game.

Download: [Addons pack](#)

Edit: I'd initially thought there were handling differences between 0.5.3 and 0.5.4, but it looks like I just got used to it.

Edit2: There's a bunch of cheat codes as well. Press tab while playing and type:

nuke
skip
goto <levelnum>
lives
die
quit
coords
freemode
godmode
timebonus
