Well, step1 is to check, that the the file libqsqlite.so is in qt:plugins/sqlplugins. If not, find it in one of the release archives. step2 is to check, if your qt: assign is set up correctly. It should point to the root of your qt installation. step3 is to check, if you have libsqlite3.so in your Sys:SOBjs/ folder, and that it is the correct version. I think there are at this point quite a lot of different versions of that one floating around, and not every one of them will work with qt. I think I included one version in the Qt installation, that should work no matter what. Get that one and throw it in Sys:SOBjs/ (while renaming any other existing version that might lye there). The version I am using is datestamped 22nd of March 2010.

EDIT: And for precisely that reason it is important to check out (just run, once) one of the sql examples from the Qt package to see, if the problem is somehow specifically Brewtarget or a general Qt setup issue on your system. Do you have OS4.1 Final installed? Dunno if that would change certain things, since I have never had the chance to experience it.
