@Chris

In my experience, it is not irrelevant. I think there are instances of the linker needing to actually make the connection to the relevant symbols, although the details elude my memory. Anyways, just the indication, that the linker warnings still appear although the relevant objects are in the lib directory, indicates, that there is something wrong at the linker level.

Probably the problem is, that you forgot to add the relevant dependencies to your link. I.e.

In `<whatever> -l QtSql -l sqlite3`

This is all handled automatically by the build process if you use qmake or cmake. Which is one of the many reasons to stick to those.
