Well, it looks like it is looking for ...

sqlitedrivers:

...which is of course wrong. So something with path handling. Hmm.

It should of course be looking for Qt:plugins/sqldrivers. Maybe your Qt: assign is not set properly? Sometimes I have seen weird backtrack strategies for paths; which mean that a certain app works when somewhere in the Qt: directory but not when moved outside. Did you use the installer to install Qt or did you do it manually? If it doesn't find the Trolltech config file, it could be a sign of something like that. Otherwise I have no clue at the moment.
