URL:

I am unable to get COW3D to work. I do have an X1000, 4.1FE, Warp3D installed, MiniGL installed, downloaded the 2012 Cow3D, followed the install.

INSTALLATION Install Warp3D.library or Wazp3D.library Copy Cow3D-Amiga and the textures Cow_256X256X32.RAW & Cosmos_256X256X32.RAW where you want

I have Warp3D so that is what I have in my Libs drawer. I installed the 3 COW3D files on my Work directory. I double click the Cow3D-Amiga file then click OK to execute, it brings up a black window showing FPS and such on the top, but no cow. Nothing in the black window.

Do I need to click something to start the COW and it come on the screen?

I did download the TuxCart and it runs so I believe my Warp3D is running.
